Trans. of Akademiya Nauk URSR [Kiev. Institut Metallofiziki]. Sbornik Nauchnykh Rabot, 1955, v. 6, p. 85-91.

An analysis is made of diffusion plasticity based upon the diffusion-deformation resistance relationship at high temperatures. A determination is made of conditions corresponding to maximum strength of a solid solution at temperatures at which rates of diffusion are significant, specifically, when melting temperature decreases with concentration of the secondary alloying element. At high temperatures the composition of an alloy shifts with temperature increase in the direction of the solvent.

DESCRIPTORS: Ferromagnetism, *Magnetic materials, Metals, Dislocations, Crystal structure, Annealing, Temperature, Theory, *Coercimeters.

In conformance with modern theories of coercive force and under the assumption that dislocation-type defects in the crystalline structure are formed during high-temperature quenching in a metal, there is analyzed their interaction with the domain structure. A computation of the dependence of the coercive force on the time of low-temperature annealing is in good agreement with experimental results.
